

BidScope Automation Script

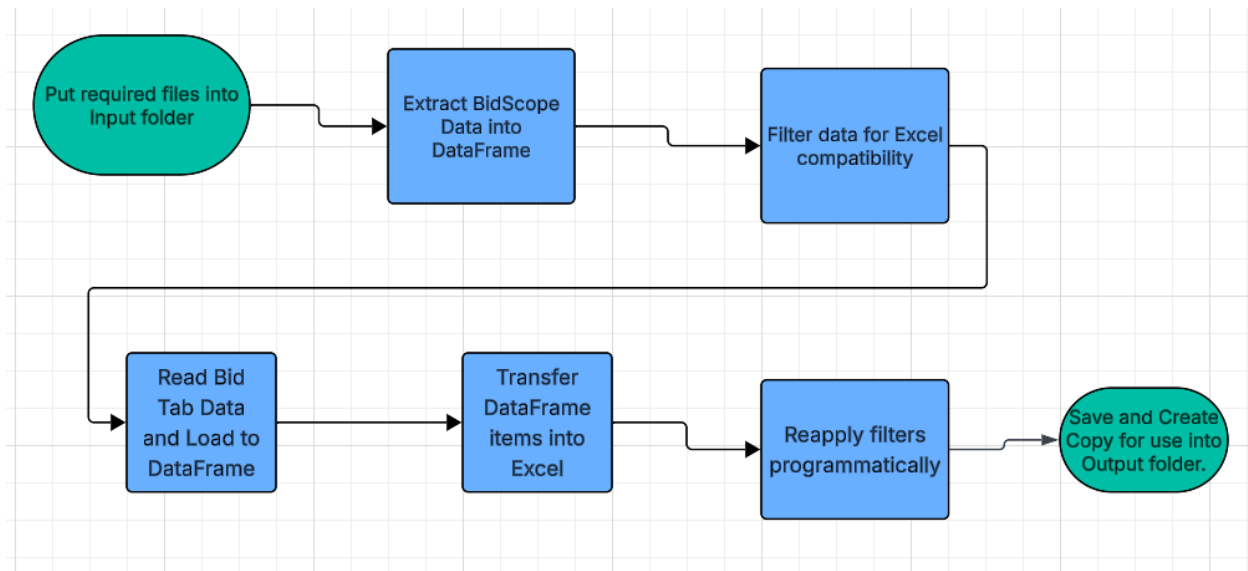

This is a lightweight ETL script that automates much of the process of uploading data from BidScope into Excel.

Overview

Manually updating weekly metrics is prone to formatting errors and gaps. This script automates the pipeline removing much of the data entry except for the tab names. In summary, the data pipeline follows these relative steps:

1. Read BidScope MB1, MB3 and MB4 csv files.
2. Convert to Pandas DataFrame and Transform Data (filter it so it is able to be processed in Excel)
3. Scrape Bid Tab data from PDF and process it into its own DataFrame
4. Use ExcelWriter function to transfer MB and Bid Tab data into a new spreadsheet and rename tabs
5. Saves the finished Excel file and creates a copy “Beautiful Spreadsheet Filled”

Script Workflow (made in LucidChart)

How to Use

You will need the following documents:

- (MB1) Lowest Six Bidders (List of Bidders)

- (MB3) Low Six Bidders by Budget
- (MB4) Low Six Bidders by Items
- BidTab

1. Put the respective files into the “Input folder”, and make sure each file is named exactly like the files in the screenshot. DO NOT DELETE BEAUTIFUL SPREADSHEET as that is the initial file we will be modifying.

Name	Date modified	Type	Size
 Beautiful Spreadsheet (DO NOT DELETE)	7/6/2026 9:01 AM	Microsoft Excel W...	612 KB
 Bid Tab	6/15/2026 9:57 AM	Microsoft Edge P...	100 KB
 ListofBidders	6/23/2026 3:47 PM	Microsoft Excel C...	2 KB
 LOWSIXBIDDERSBYITEMS	6/22/2026 2:49 PM	Microsoft Excel C...	211 KB
 LowSixbyBudget	6/23/2026 8:59 AM	Microsoft Excel C...	8 KB

2. After putting in the files run the batch file named “run this”

 .idea	7/2/2026 9:07 AM	File folder	
 .venv	7/1/2026 2:38 PM	File folder	
 Input	7/2/2026 9:10 AM	File folder	
 Output	7/2/2026 9:11 AM	File folder	
 Beautiful Spreadsheet	7/2/2026 9:12 AM	Microsoft Excel W...	515 KB
 process_reports	7/2/2026 9:34 AM	PY File	10 KB
 run this	7/1/2026 2:53 PM	Windows Batch File	1 KB

The file will read the files in the Input folder and automate the previously manual data entry process into a new file inside the Output folder called “Beautiful Spreadsheet Filled”. Don’t forget to double-check your results to ensure accuracy!

*Don’t worry about libraries if you don’t have them, the script will automatically download the required libraries if you don’t have them upon first running it!

*Make sure Excel is closed before you run the script!
